

MAT 321 Homework 2

Spring 2019

Due date: Tuesday, Jan 22

1. Problems in the text, pages 193-195: 8,9.
2. (Inverse Z-transform, section 8) Use a reson filter with pole angle $\theta = \pi/8$ and pole radius $R = 0.99$. Use input unit step signal and compute the output signal values y_0 , y_1 , and y_2 by each of the three methods in the text. You may round the transfer function coefficients to 2 decimal places.
